About the Mt Isa East Project

Mt Isa East Project which comprises five granted Exploration Permits for Minerals (EPM) (EPM 27698, EPM 27699, EPM 27700, EPM 27701 and EPM 27782) covering a combined area of approximately 1,300 km² in the Mount Isa district of north-west Queensland which are considered to be prospective for copper and gold.

The preferred mineralisation model adopted for the project area is structurally controlled epigenetic copper ± gold ± iron oxide (IOCG). This style of mineralisation has provided the bulk of historical copper production in the Mount Isa Inlier. Deposits are epigenetic and syntectonic within brittle-ductile mid-crustal to brittle upper crustal deformation regimes.

The Project area targets a strong network of shear zones and breccias between two major regional structures that are associated with Cu-Au-rich mineralisation. Numerous large-scale splays are linked to the major 'first order' structures exposed at surface and host numerous copper workings and identified areas of copper mineralization.

About Revolution Mining Pty Ltd

Revolution Mining is a Perth-based private exploration company focused on early-stage exploration of a growing portfolio of regional mineral interests in Western Australia and Queensland. Our aim is to create value through strategic project generation and exploration from discovery stage to value creation for our stakeholders. Revolution's management team uses experienced exploration industry personnel to identify properties that are highly prospective for mineralization in favorable jurisdictions, close to exiting infrastructure and development opportunities.
